

Step 1

Inbound, outbound and internal emails are sent to the mail server; then inbound SPAM is filtered out.

Step 2

The mail server makes a copy of every email. One copy is sent to the appropriate mail user; the other copy is sent to the Defender.

Step 3

Mail to the Defender is indexed, compressed and archived.

Step 4

Users can access Defender locally or remotely via web browser or PDA to restore emails deleted from the mail server.

Step 5

The Defender encrypts all data between the appliance and users to ensure data security.

Step 6

When emails are restored, the Defender sends a copy back to the mail server, which is then fully accessible and sends daily performance evaluations to administrators.
